

The
Morpheus
CAPO™
gives your
guitar instant
polyphonic
up tuning
in 1/2-step
increments
up to 3 1/2
steps —
plus full
Octave and
Octaver.

Our CAPO™ pedal's sibling, the DropTune™, has taken the guitar world by storm because it does something no other pedal has ever done before. Now we've done it again — except upscale!

Finally, you can electronically capo your guitar and maintain perfect pitch. For example, play an E chord in standard tuning, then use the Capo pedal to up tune your guitar so the chord is changed to an F, F#, G, G#, A, Bb or B.

In addition, the CAPO pedal has Full Octave Up Pitch and a great-sounding Octaver/12-string emulator that causes your 6-string to sound like a 12-string, with octaves for strings 3 through 6, and

doublers on strings 1 and 2.

The Morpheus CAPO™ pedal also features effect-toggling so you can instantly toggle back and forth between the up pitch and the EFFECT OFF for a cool up/down pitch-shift effect during rapid ascending/

descending arpeggios and scale runs.

Don't mistake this for a mere pitch shift stompbox. The CAPO uses proprietary polyphonic pitch up algorithms that maintain perfect harmonic accuracy and tonally correct overtones — you have to →

CAPO↑

POLYPHONIC PITCH UP

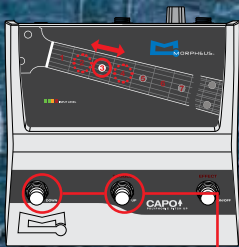

hear this pedal to believe how real it sounds!

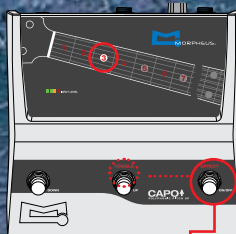

Not surprising considering the CAPO™ has been developed by a team of guitar effects pros with over fifty total years of experience at other companies where they created some of today's most famous pedals.

With a cast metal chassis, solid positive-feeling steel step switches and non-skid rubber feet, the CAPO is solidly built for years of use and abuse. LED indicators are bright and easy to see.

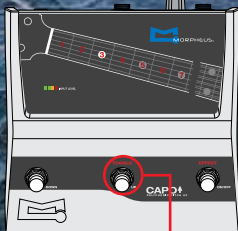

If you're looking for fast, pitch-perfect capoing, listen to the demos on our website...or better yet, try out the CAPO in person at your Morpheus dealer.

In EFFECT OFF mode, the DOWN switch decrements pitch and the UP switch increments pitch. The note indicators indicate the amount of up tune. Guitar signal is unaffected until EFFECT ON is selected.

Switching to EFFECT ON engages the selected or previous capo setting and also engages the TOGGLE feature. The DOWN switch remains active for decrementing the pitch.

Press/release the TOGGLE switch to switch back and forth between the up tune setting and the unaffected guitar signal.

- 2 Proprietary polyphonic up pitch
- 2 Up tune up to 3½ steps in ½-step increments
- 2 Full Octave Up Tune and Octaver/12-string emulator
- 2 Latching EFFECT ON/OFF switch
- 2 Momentary DOWN and TOGGLE/UP switches
- 2 Bright backlit UP TUNE, OCTAVE, OCTAVER, TOGGLE and EFFECT indicators
- 2 Rear panel TRIM LEVEL control with front panel LED level display
- 2 IN, OUT and power supply jacks (power supply included)
- 2 Patent Pending
- 2 Rugged cast-metal chassis
- 2 Two-year limited warranty
